

CSE 3241 Project Checkpoint 02 – Relational Model and Relational Algebra

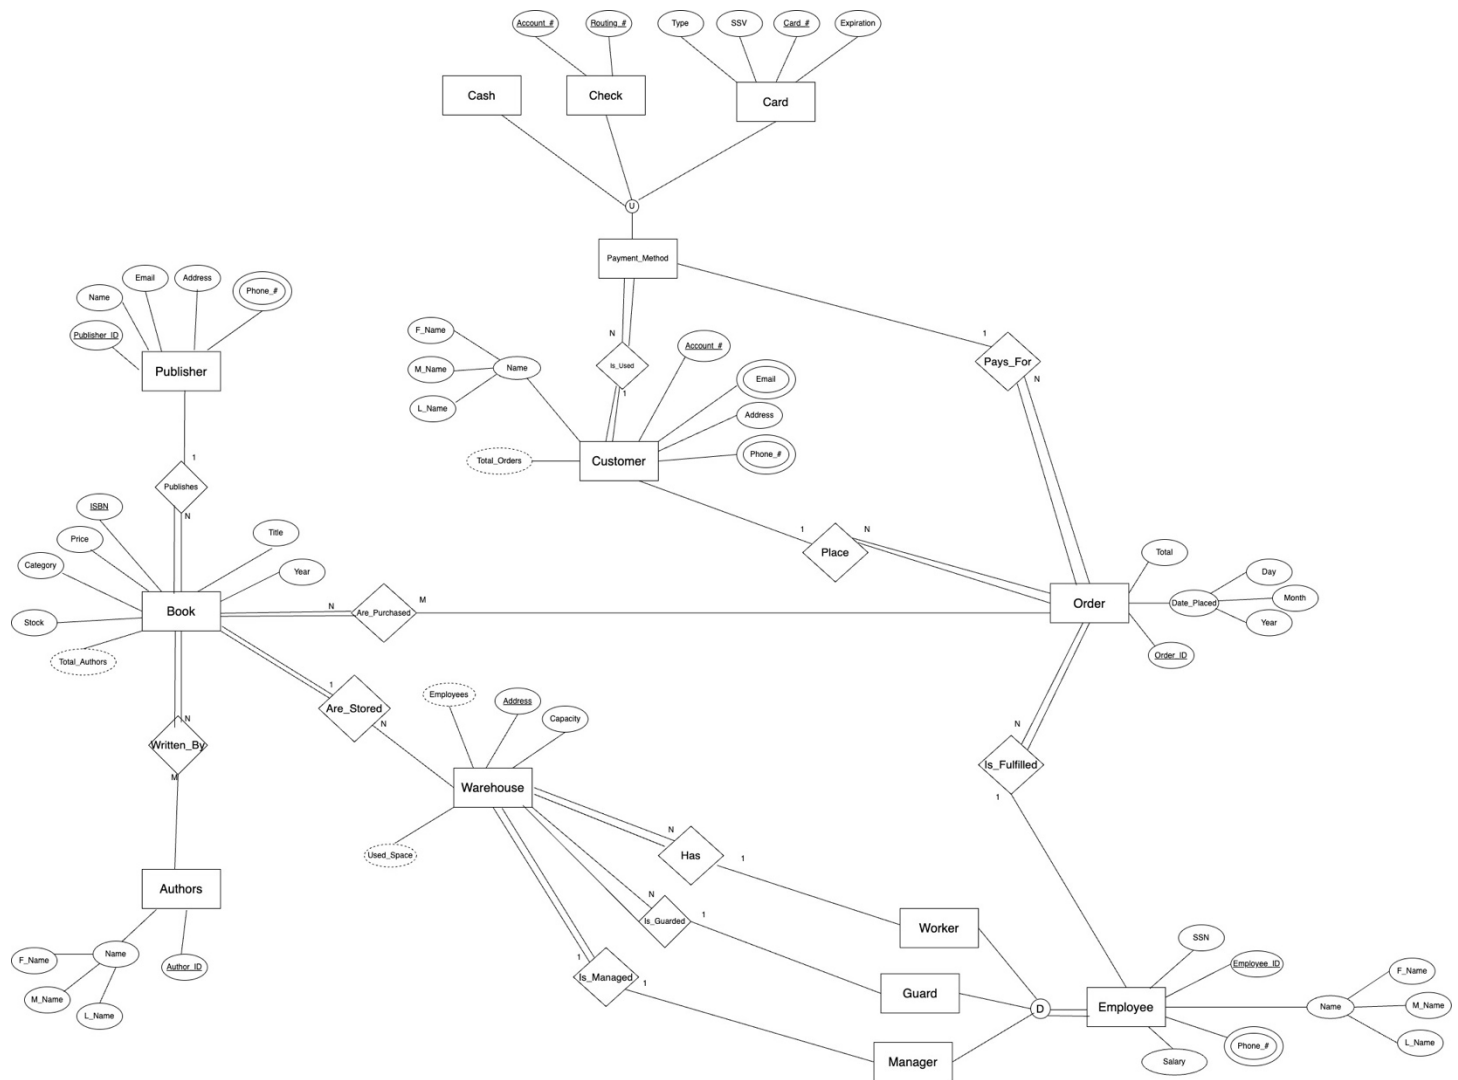

Names

Date 2/19/25

Massimo Adams, Charlie Cavallaro, Keenan Darkins, Samuel Ellerbrock

In a **NEATLY TYPED** document, provide the following:

1. Provide a current version of your ER Model as per Project Checkpoint 01. If you were instructed to change the model for Project Checkpoint 01, make sure you use the revised version of your ER Model.

2. Map your ER model to a relational schema. Indicate all primary and foreign keys.

Primary Keys Underlined

Publisher

Name	Email	Address	Phone_#	<u>Publisher_ID</u>
------	-------	---------	---------	---------------------

Book – Foreign Key Publisher_ID references Publisher

Title	Year	Stock	Category	Price	<u>ISBN</u>	Publisher_ID
-------	------	-------	----------	-------	-------------	--------------

Author

F_Name	M_Name	L_Name	<u>Author_ID</u>
--------	--------	--------	------------------

Warehouse - Foreign Key Employee_ID references Employee and Foreign Key ISBN references Book

Capacity	<u>Address</u>	Employee_ID	ISBN
----------	----------------	-------------	------

Order - Foreign Key Account_# references Customer and Foreign Key Employee_ID references Employee

Total	Day	Month	Year	<u>Order_ID</u>	Account_#	Employee_ID
-------	-----	-------	------	-----------------	-----------	-------------

Customer

F_Name	M_Name	L_Name	Phone_#	Address	Email	<u>Account_#</u>
--------	--------	--------	---------	---------	-------	------------------

Employee

SSN	Salary	Phone_#	F_Name	M_Name	L_Name	<u>Employee_ID</u>	Job_Type
-----	--------	---------	--------	--------	--------	--------------------	----------

Are_Purchased - Foreign Key ISBN references Book and Foreign Key Order_ID references Order

<u>ISBN</u>	<u>Order_ID</u>
-------------	-----------------

Written_By - Foreign Key ISBN references Book and Foreign Key Author_ID references Author

<u>Author_ID</u>	<u>ISBN</u>
------------------	-------------

Payment_Method

<u>Payment_ID</u>

Cash – Foreign Key Payment_ID references Payment_Method

Payment_ID

Check - Foreign Key Payment_ID references Payment_Method

<u>Routing_#</u>	<u>Checking_#</u>	Payment_ID
------------------	-------------------	------------

Card - Foreign Key Payment_ID references Payment_Method

Type	SSV	Expiration	<u>Card_#</u>	Payment_ID
------	-----	------------	---------------	------------

Customer_Phone - Foreign Key Account_# references Customer

<u>Account_#</u>	<u>C_Phone</u>
------------------	----------------

Customer_Email - Foreign Key Account_# references Customer

<u>Account_#</u>	<u>C_Email</u>
------------------	----------------

Publisher_Phone - Foreign Key Publisher_ID references Publisher

<u>Publisher_ID</u>	<u>P_Phone</u>
---------------------	----------------

Employee_Phone - Foreign Key Employee_ID references Employee

<u>Employee_ID</u>	<u>E_Phone</u>
--------------------	----------------

3. Given your relational schema, provide the relational algebra to perform the following queries. If your schema cannot provide answers to these queries, revise your ER Model and your relational schema to contain the appropriate information for these queries:

σ Π

- a. Find the titles of all books by Pratchett that cost less than \$10
 $R1A \leftarrow \sigma(\text{Price} < 10)(\text{Book})$

```

R2A <-- Written_By ⋈(ISBN=ISBN)R1A
R3A <-- σ(Author_Id = Pratchett's ID)
ResultA <-- Π (Title)(R2A⋈(Author_ID=Author_ID)R3A)

```

- b. Give all the titles and their dates of purchase made by a single customer (you choose how to designate the customer)

```

R1B <-- σ(Account_# = CustomerOfChoice)(Customer)

R2B <-- R1B⋈(Account_#= Account_#)Order

R3B <-- R2B ⋈(Order_ID=Order_ID)Purchased

R4B <-- R3B ⋈Book

ResultB <-- Π(Title,Day,Month,Year,Fname,Lname,Account_#)R4B

```

- c. Find the titles and ISBNs for all books with less than 5 copies in stock

```

R1C <-- σ(Stock<5)(Book)

ResultC <-- Π(Title,ISBN)(R1C)

```

- d. Give all the customers who purchased a book by Pratchett and the titles of Pratchett books they purchased

```

R1D <-- Written_By ⋈(ISBN=ISBN)Book
R2D <-- σ(Author_Id = Pratchett's ID)
R3D <-- R2D ⋈(ISBN= ISBN)Purchased
R4D <-- R3D ⋈ (Order_Id=Order_Id) Order
R5D <-- R4D ⋈ (Account_# = Account_#) Customer
ResultD <-- Π(Title,Total,Fname,Lname)R5D

```

- e. Find the total number of books purchased by a single customer (you choose how to designate the customer)

```

R1E <-- σ(Account_# = CustomerOfChoice)(Customer)

R2E <-- R1E⋈(Account_#= Account_#)Order

ResultE <-- Π(Count(Order_ID), Fname, Lname, Account_#)(R2E)

```

- f. Find the customer who has purchased the most books and the total number of books they have purchased

```

R1F <-- Customer⋈(Account_#= Account_#)Order

R2F <-- σ(⋈Max(Sum(Total)))R1F

ResultF <-- Π(Fname,Lname,Account_#)R2F

```

4. Come up with three additional interesting queries that your database can provide. Give what the queries are supposed to retrieve in plain English and then as relational algebra. Your queries should include joins and at least one should include an aggregate function. At least one of your queries should use “extra” entities you added to your model in Checkpoint 01.

Get the amount of orders fulfilled by a given employee:

$R1G \leftarrow \sigma(\text{Employee_ID} = \text{Given Employee})(\text{Employee})$

$R2G \leftarrow R1G \bowtie \text{Is_Fulfilled}$

$\text{ResultG} \leftarrow R2G \rhd \text{Count}(\text{Order_ID})$

Get the most often payment type:

$R1H \leftarrow \text{Order} \bowtie (\text{Order_ID} = \text{Order_ID}) \text{Payment_Method}$

$R2H \leftarrow R1H \rhd (\text{Count}(\text{Payment_ID}) \rightarrow \text{PaymentCount}) (\text{Payment_ID})$

$R3H \leftarrow \sigma(\text{PaymentCount} = \text{Max}(\text{PaymentCount})) (R2H)$

$\text{ResultH} \leftarrow \Pi(\text{Payment_ID}, \text{PaymentCount}) R3H$

Get the cost of books that are stocked the highest:

$R1K \leftarrow \sigma(\text{Stock} > \text{Book} \rhd \text{Average}(\text{Stock})) \text{Book}$

$\text{ResultK} \leftarrow \Pi(\text{Title}, \text{Price}, \text{Stock}) R1K$
